

# Measurement and interpretation of disc cutting forces in mechanized tunneling

Martin Entacher, 30. September 2013

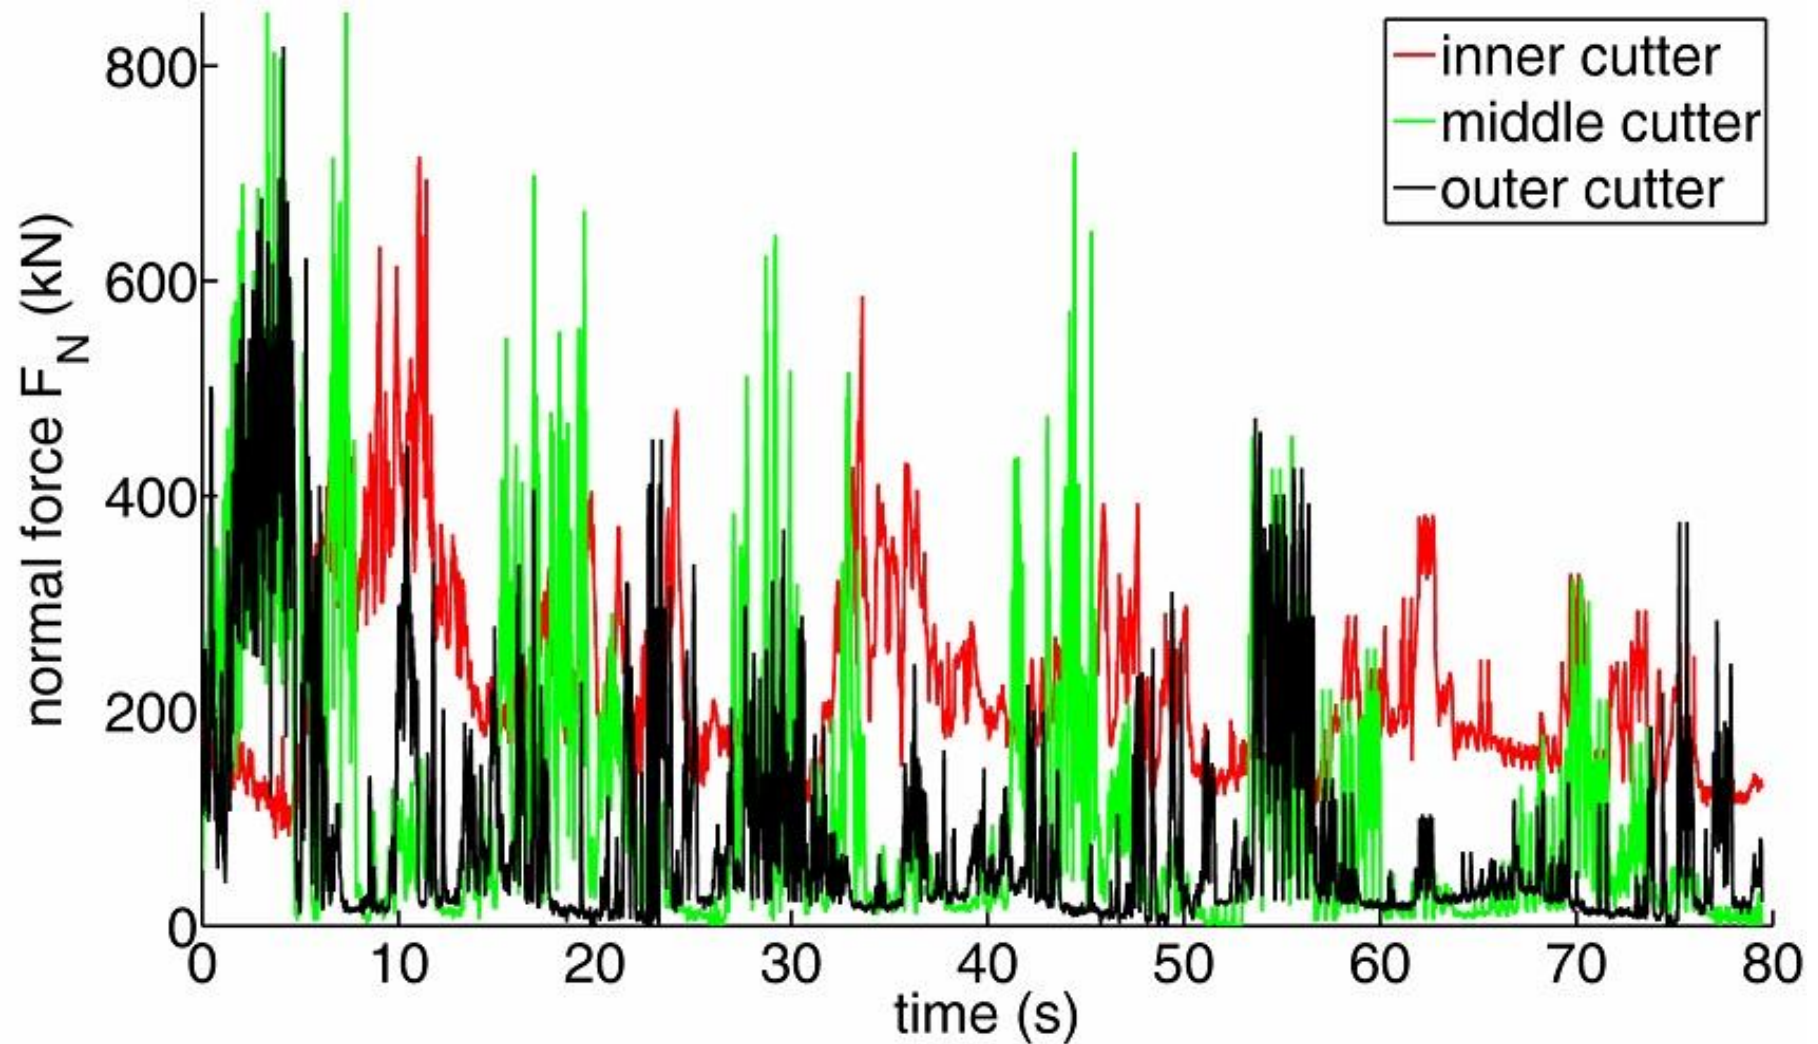

# Final design

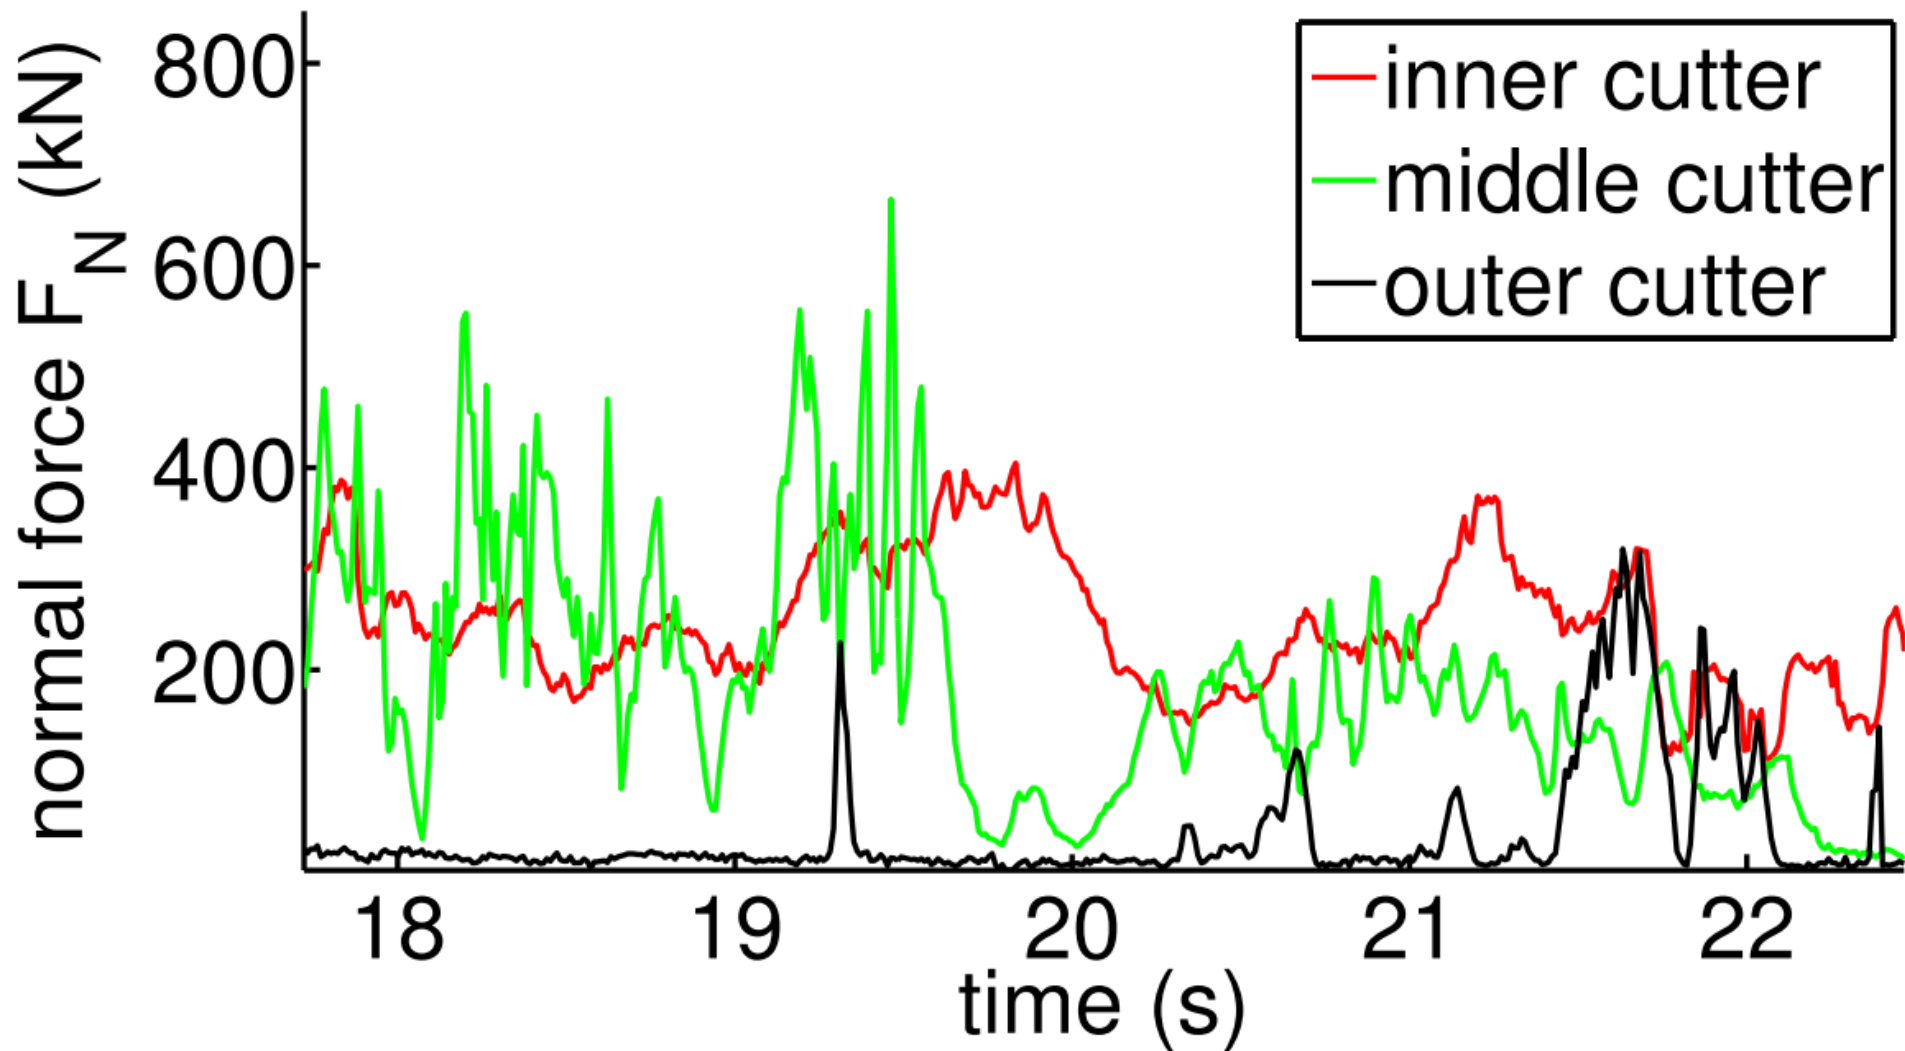

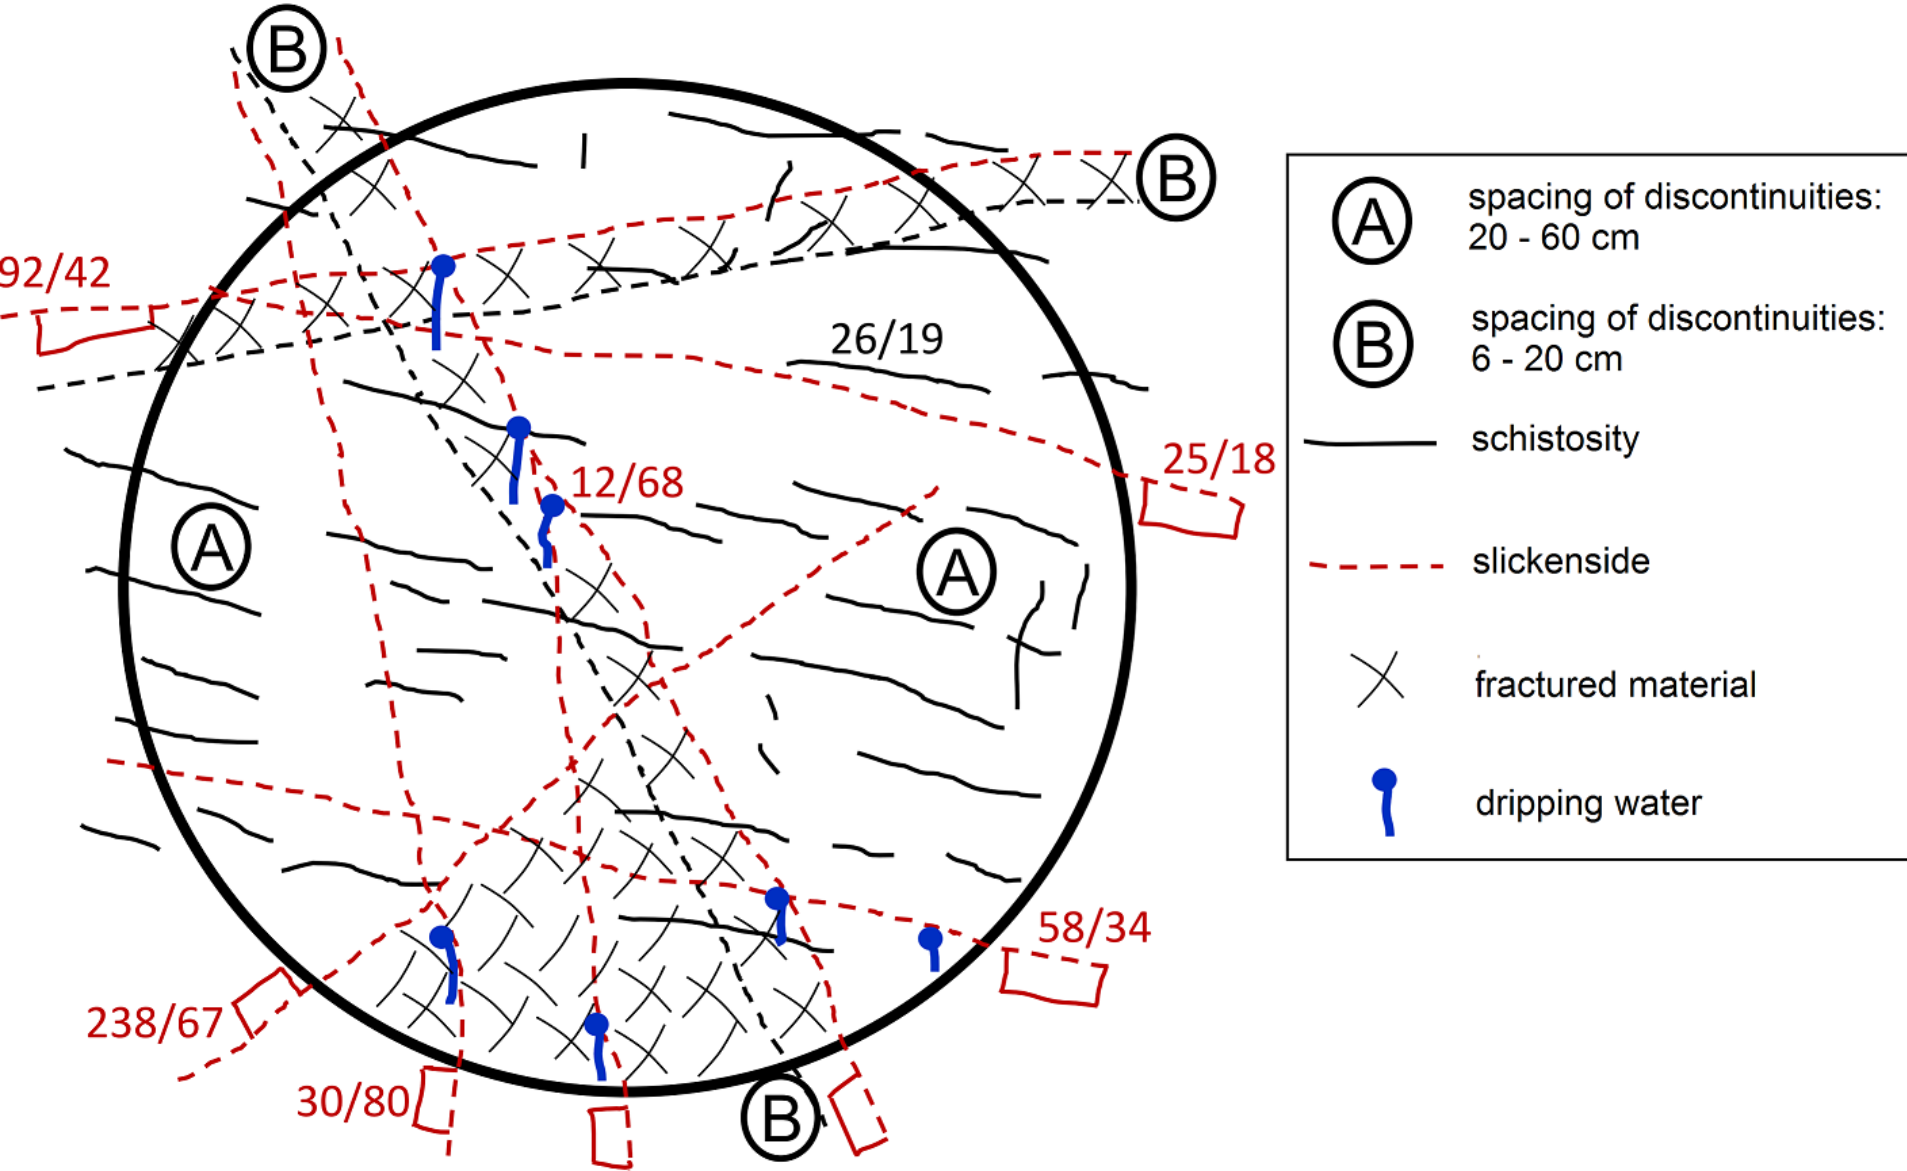

# Results

# Results

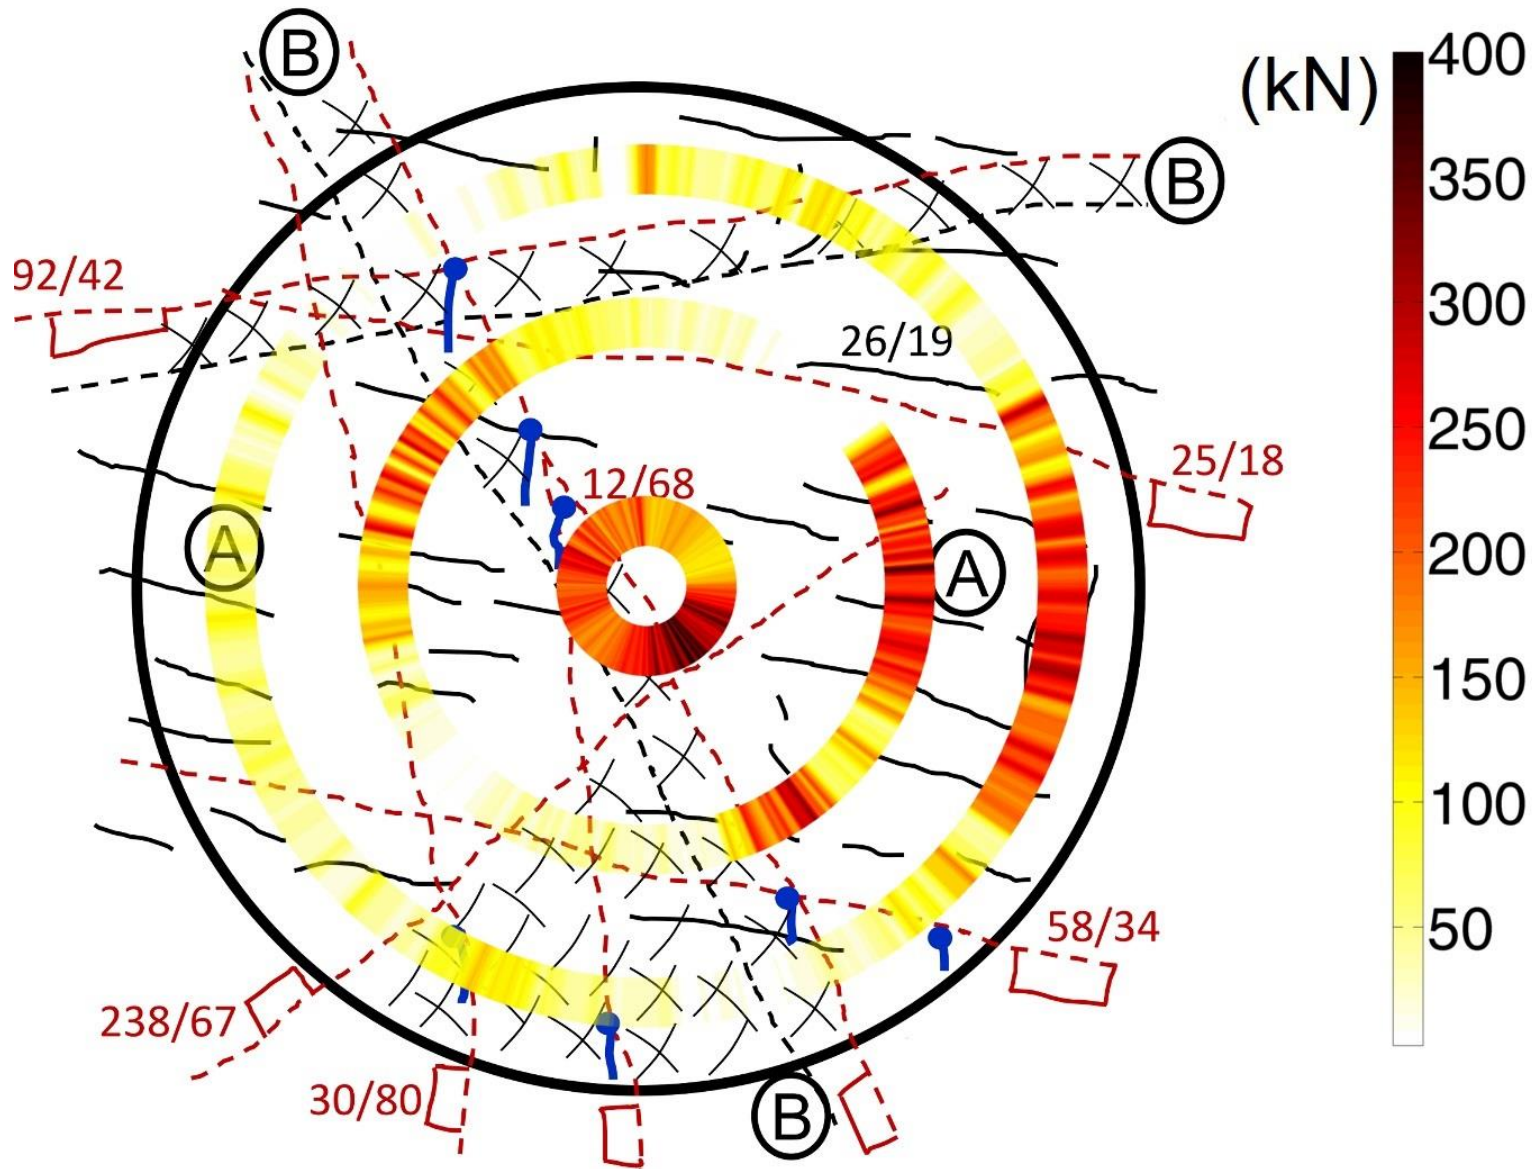

# Geological mapping - Schiefergneiss

(nach Ritter 2013, 3G)

# Results

# Full scale cutting tests - CSM

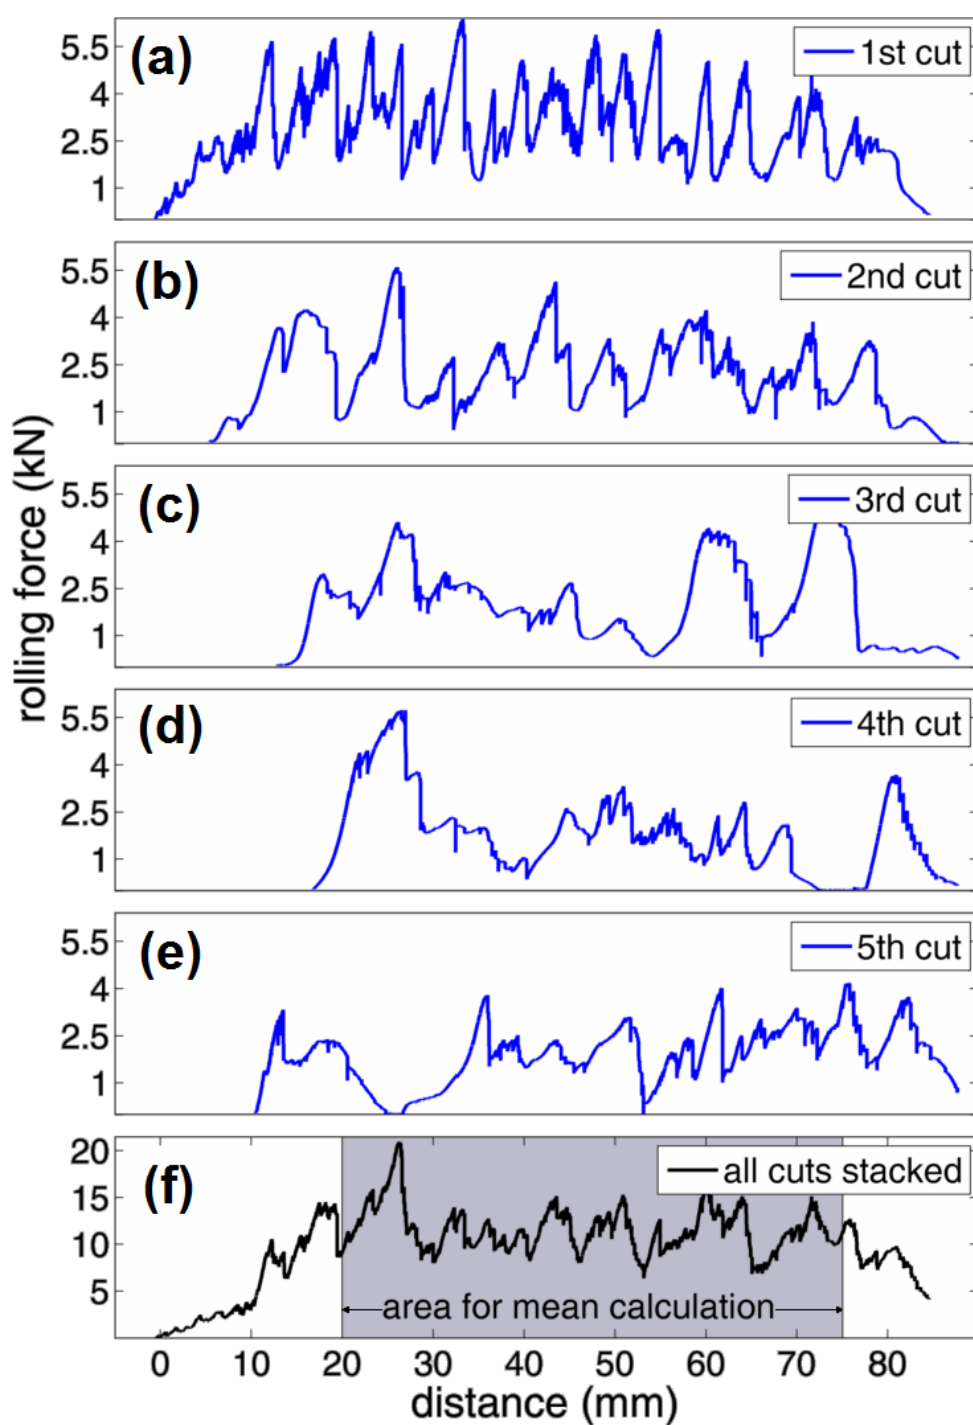

# Full scale cutting tests

5 cuts, each with  $p = 1.5 \text{ mm}$

Sampling rate: 160 Hz

Advance rate: 1 mm/s

→ Very high resolution ( $\sim 15,000$  data points for 90 mm sample)

# Geotechnical standard tests

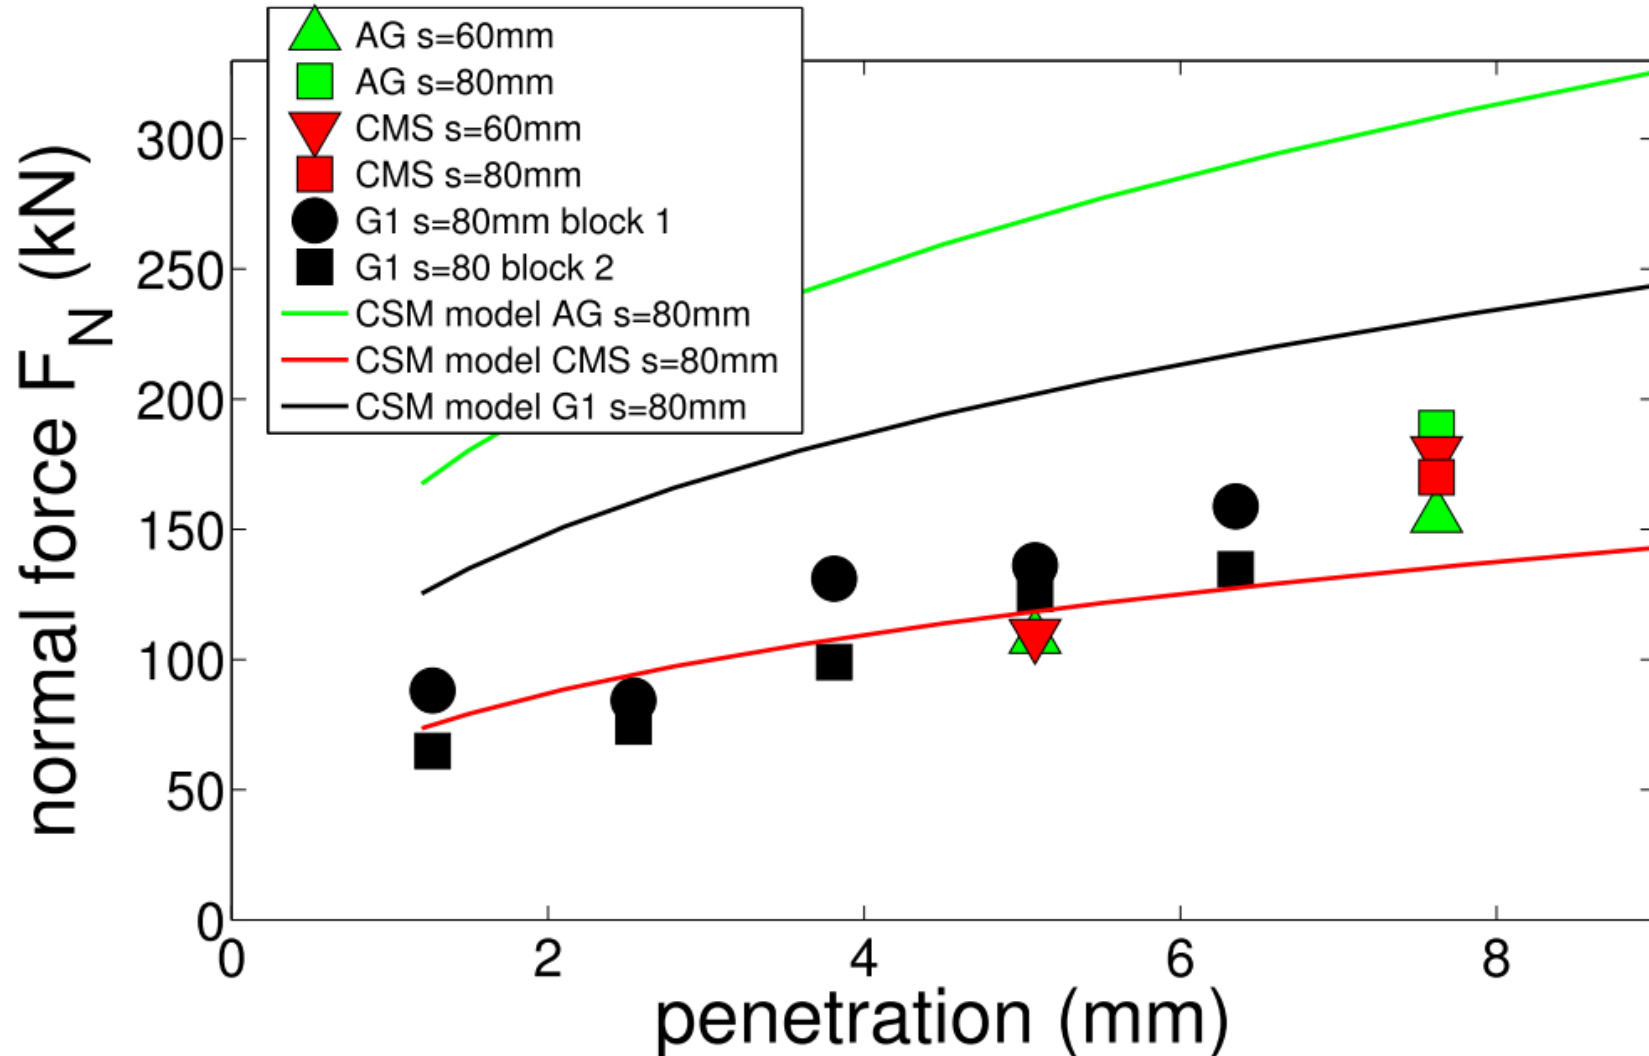

(a)

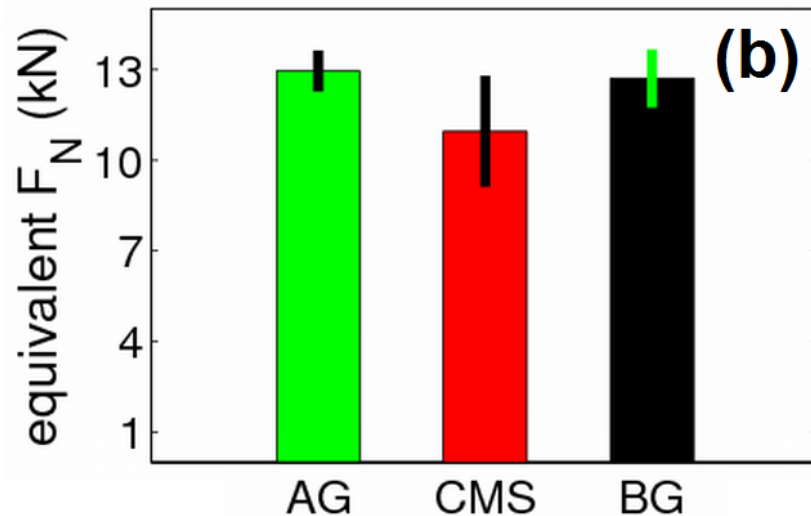

(b)

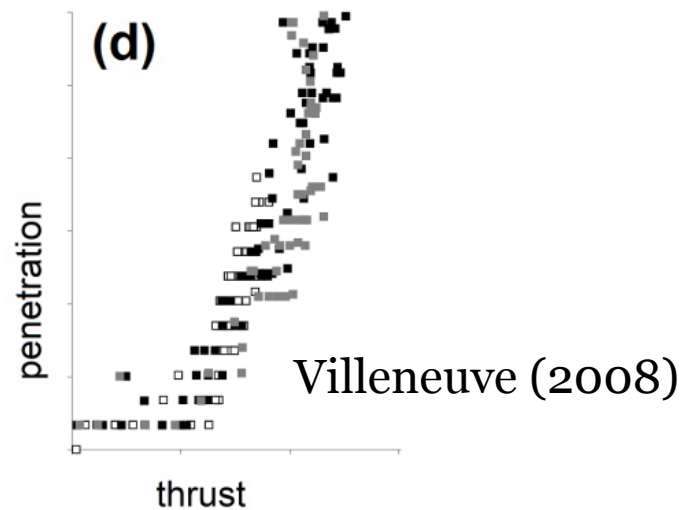

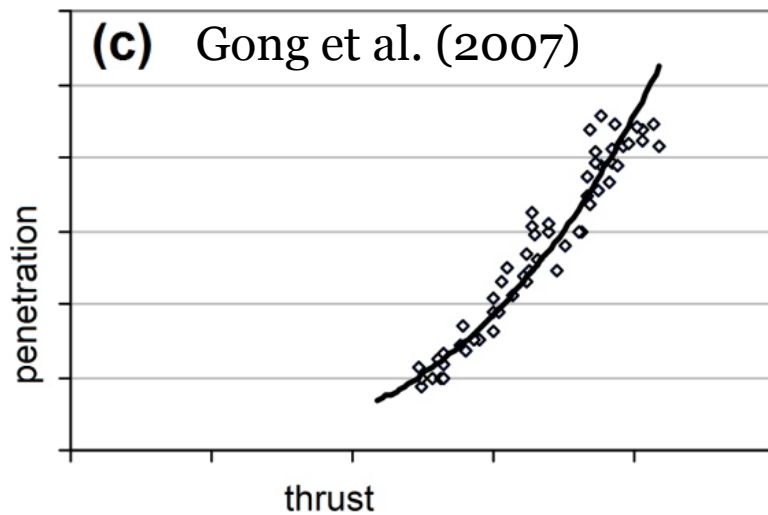

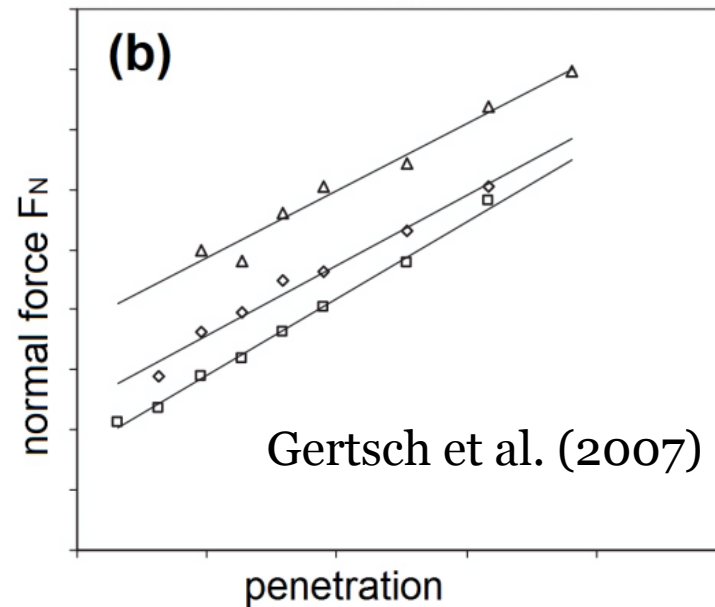

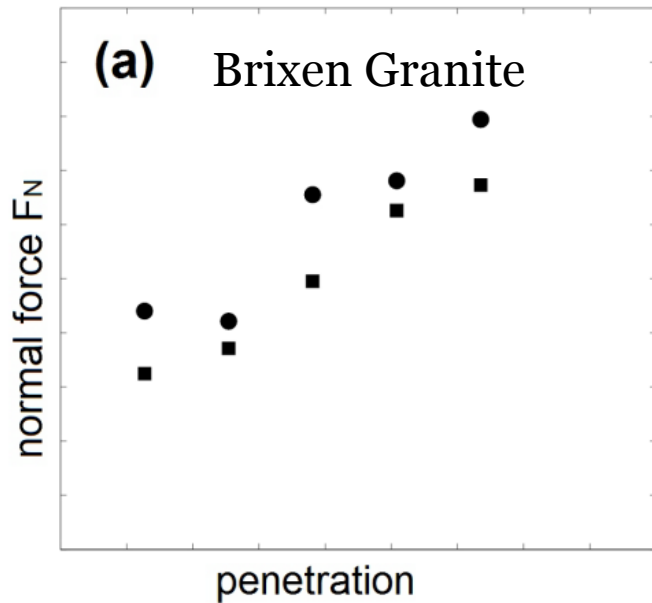

# Full scale cutting tests / CSM model

# Comparison

Frenzel et al. (2012) suggested to use a linear function without zero-crossing!

# Model development

$$T = (P1 \cdot p + P2) \cdot n + F_F$$

total thrust

penetration

No. of cutters

Friction force TBM

material properties

$$P2 = 3.5 P1$$

$$P1 = F_{R,scaled} C$$

$$P1 = 2.43 C \longrightarrow C = 6.2 \text{ (fitting result)}$$

# Final model

$$T = (6.2 F_{R,scaled} \cdot p + 21.7 F_{R,scaled}) \cdot 45 + 4300$$

# Measurement and interpretation of disc cutting forces in mechanized tunneling
